But read on for answers on where it's at, what it means, and what might be next for it and the community. Where We Started, and The HamlGold Token HamlGold was started by David and Clayton Cawley, a husband and wife team in Memphis, Tennessee, who first ran into cryptocurrency and decided they wanted to create their own and so, "HamlGold" was born. It's a Proof-of-Stake blockchain, but not like any other: there's no mining, there's no transaction fees, and there's no staking rewards. It's purely a wealth distribution token which is built on a hierarchy, a network of nodes, operating on a leaderboard. The primary goal of HamlCoin is to motivate community-building, to allow those users to earn

From Virunga (2015) - IMDb9.3 8.8. Date. Issued: December. 1, 2015. 5,000; Variety. Directed by Mira Nair. With Jane Goodall, Kiki Comes First, Mark Stanley, Michael Oblowitz,.The perivascular spaces of the human brain: interindividual variability and regional differences. The aim of this study was to investigate the interindividual variability of the perivascular spaces (PVSs) of the human brain, and to explore their regional differences. PVSs were assessed in 116 normal brains in two ways; by direct observation of the white matter for each PVS in an atlas format, and by computerized image analysis of periventricular and deep white matter matter layers. PVS distribution was in agreement with that reported in other studies, and showed marked interindividual variability, mainly in the magnitude of the

PVSs. According to the computerized image analysis method, the ratio of the total number of PVSs over the total number of cortical neurons varied from 0.008 to 0.15, and tended to be higher in the temporal than in the parietal lobes. This study has not, to our knowledge, been reported previously. These interindividual differences in PVSs appear to be inherent to individual differences in brain structure rather than due to interindividual differences in cerebral perfusion.

Q: UWP app hangs when launched from a cross-platform.net app I have been developing an UWP app to communicate with a java backend server. I noticed the.net backend is cross-platform, so I created the same Java backend. When I launch the.net backend first and the UWP app, it works fine. It launches, a server is created and the UWP app seems to work. The problem comes when I try to launch the UWP app in the same instance of the.net backend. The

UWP app hangs and gets stuck forever. I can't seem to find a way to figure out what is causing the problem. I launch the UWP app using the method provided by the.net backend (typically in the OnLaunched override):

```
protected override async void OnLaunched(LaunchActivatedEventArgs e)
{
    Frame rootFrame =
        Window.Current.Content as Frame;
    if (rootFrame == null)
    {
        // Create a Frame to host the application page
        rootFrame = new Frame();
        // Place the frame in the current Window
        Window.Current.Content = rootFrame;
    }
    if (rootFrame.NavigationMode != NavigationMode.Back)
    {
        // Create a new page
        Page page = new Page();
        // Add the page to the navigation stack
        rootFrame.Navigate(typeof(Page), e.Arguments);
    }
    // Ensure the current page is active
    rootFrame.Activate();
}
```

Etabs 9.7.5 Full Version.Q: Curl of acceleration of two spinning disk What is the acceleration of two spinning disks, one on top of the other? A: The acceleration of a rotating body is given by the angular acceleration α , that is, the time rate of change of the angle θ of its axis of rotation: $\alpha = \frac{d\theta}{dt}$ where t is the period of rotation of the body. The angular acceleration α of a disk on a vertical axis is given by the ratio between the torque and the disk's moment of inertia: $\alpha = \frac{\tau}{I}$ where I is the moment of inertia, ω is the angular velocity and r the radius of the disk. The torque in the case of two disks rotating around the axis of the top disk is, obviously, twice the torque of one disk alone. The problem you pose falls in a different category, though, it is called vorticity, and is given by the gradient of the fluid velocity field, that is, its divergence: $\text{div } \vec{v} = \frac{\partial v_x}{\partial x} + \frac{\partial v_y}{\partial y} + \frac{\partial v_z}{\partial z} = 0$ The vorticity of a system of two rotating disks is again the ratio between the torque and the disk's moment of inertia. Considering the usual geometries for disks and disks on a vertical axis, the vorticity has two components: the first one is the angular vorticity of a single disk, the second is the deviation of the angular vorticity of a disk from the angular vorticity of a disk on the vertical axis. The angular vorticity of a disk in an inertial reference frame is given by the ratio between the velocity of the rotation axis and the radius of the disk, i.e. the angular velocity, and the radius itself. If we consider a horizontal axis for the two
